## Data backhaul of covert surveillance operation for a QLD mining company

Customer

## Secure Coast Solutions

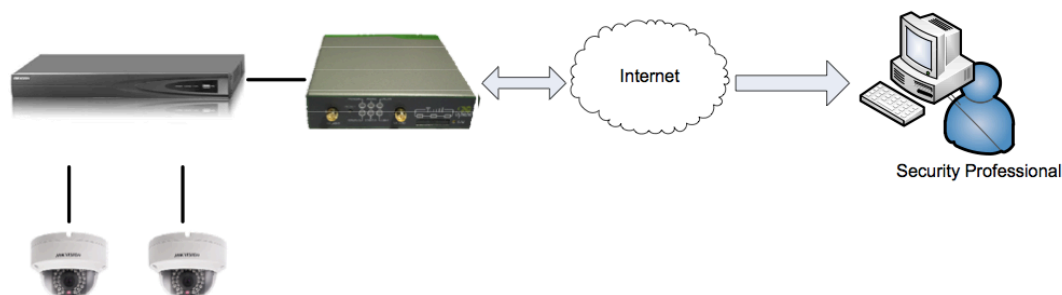

Secure Coast Solutions specializes in the installation and servicing of Electronic Security Systems. With focus on the Industrial and Commercial sectors, Secure coast solutions provides a wide range of equipment and services

Application

A covert CCTV system requires a low-profile, compact and reliable cellular communication device to allow constant remote access.

The Inhand® Industrial Router builds a reliable communication channel over Telstra's cellular network for customer to logon to the system on a daily basis.

The solution:

InRouter 611, the compact industrial grade router builds a reliable data connection between the NVR (Network video recorder) and the internet. Through Telstra cellular network, IR611 obtains a dynamic public IP address, then it always binds the address with a DDNS service for easy access.

Also external port is directly mapped to the NVR to allow remote access through web browser or smart phones. To the security professional, they can then operate and monitor on-site security systems remotely to deliver their services.
